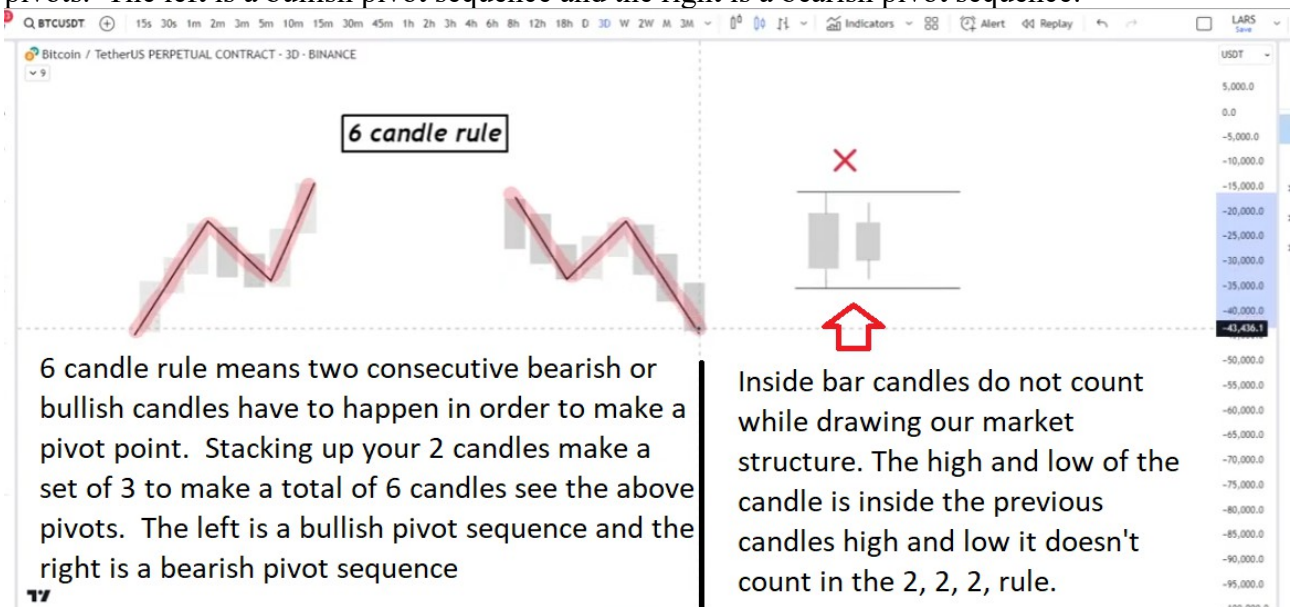
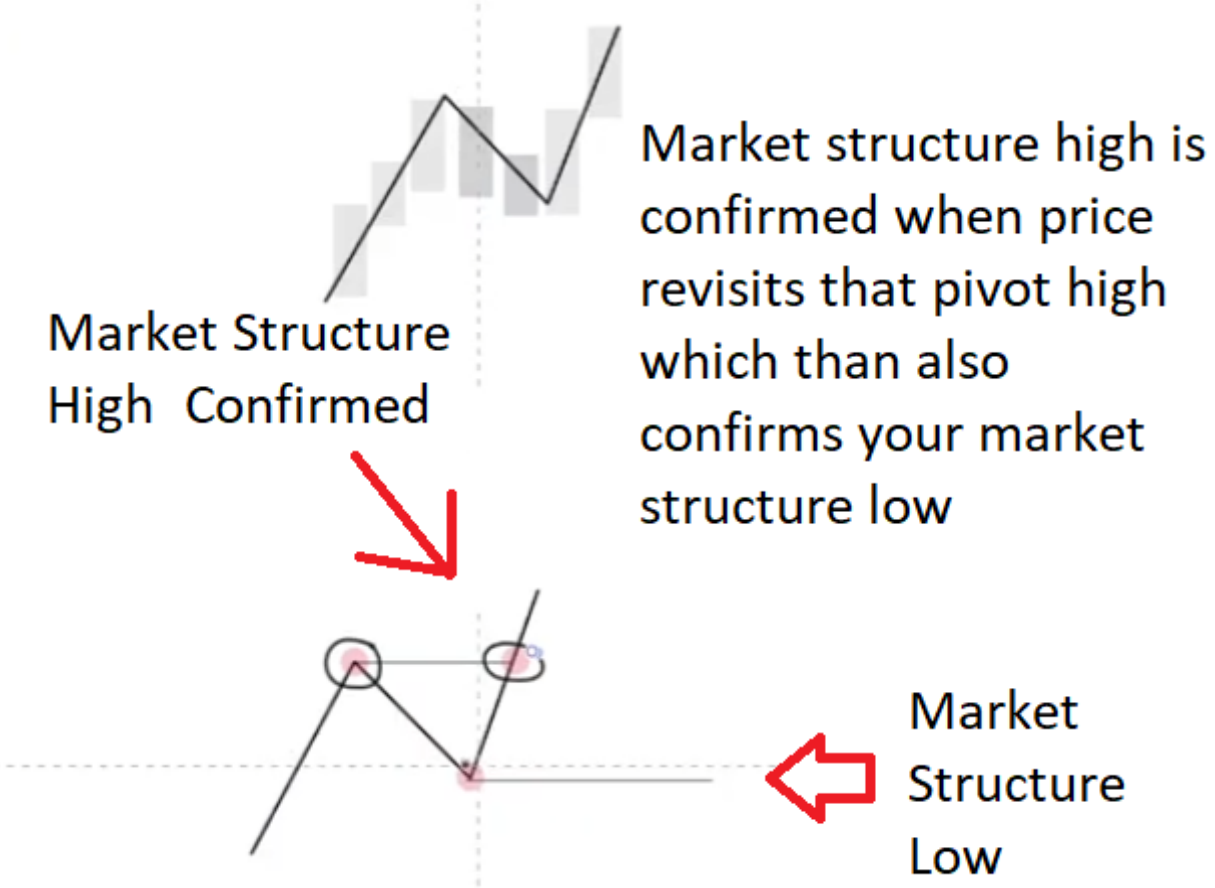
TCT mentorship – Lecture 1 | Market Structure https://www.youtube.com/watch?v=hh-25sm_jk0&list=PLrvp9-Ld55eDzJ0xXGuhPujx4by_iQ4rD&index=3

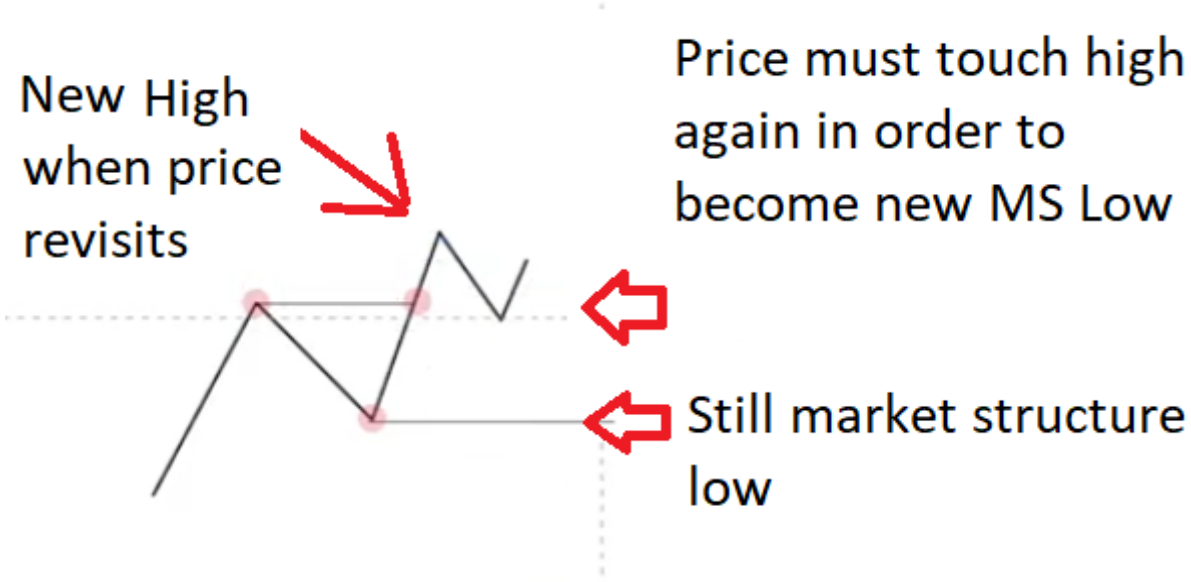
We use market structure to build context which is key to this model of trading. Lets start with the concept of how markets move. They either move up or down so we arrive at pivot points. The TCT model rule for finding valid market structure is using pivot points using the 6 candle rule. The 6 candle rule means two consecutive bearish or bullish candles have to happen in order to make a pivot point. Stacking up your 2 candles make a set of 3 to make a total of 6 candles see the above pivots. The left is a bullish pivot sequence and the right is a bearish pivot sequence:



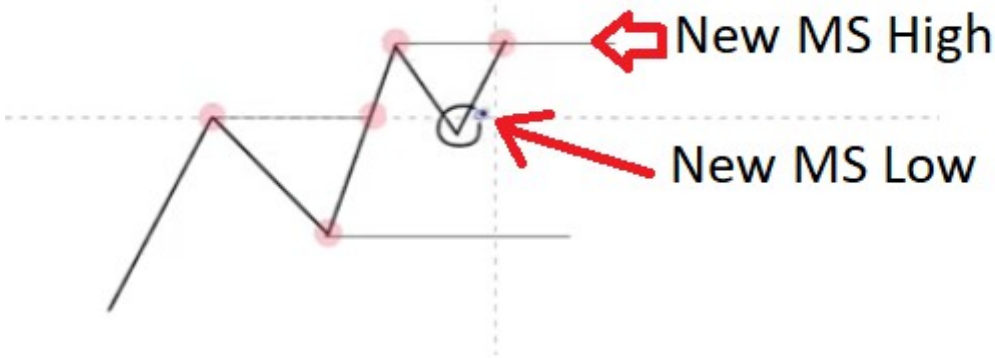
The inside bar candles(a candle thats high and low are inside the previous bars high and low) do not count when drawing our market structure. Meaning a inside candle that follows a 2, 2, 2 rule to make the 6 candle rule valid.



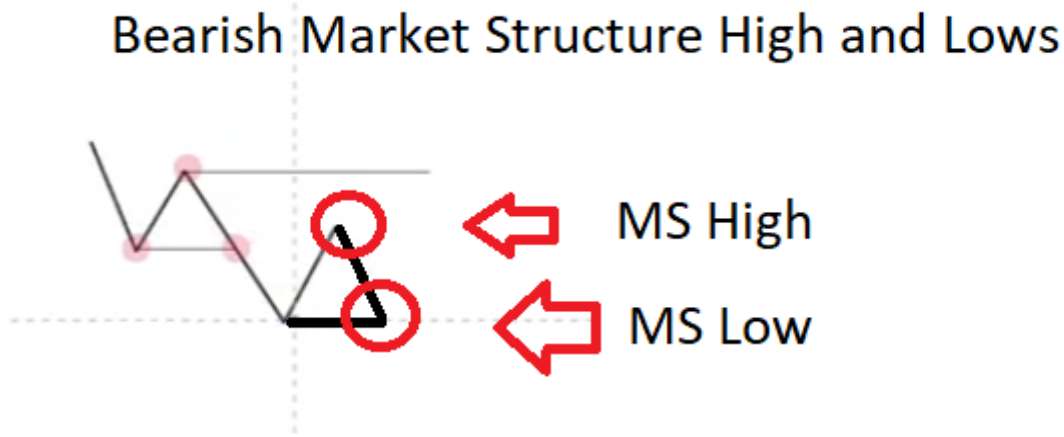
Next we look for the next market structure high and confirm it when price revisits that high, and at the same time you get your new market structure low:



So when we get our new market structure high and low it will look like this:



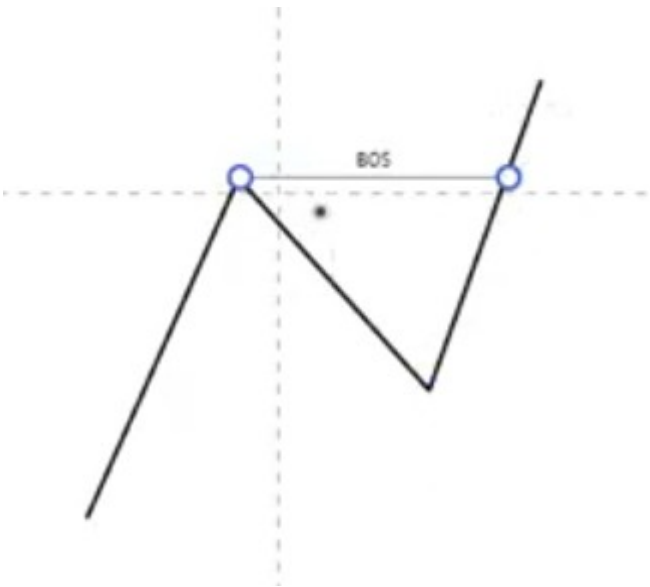
Bearish Market Structure High and Lows. Our market structure high can only be confirmed when we touch our market structure low again:



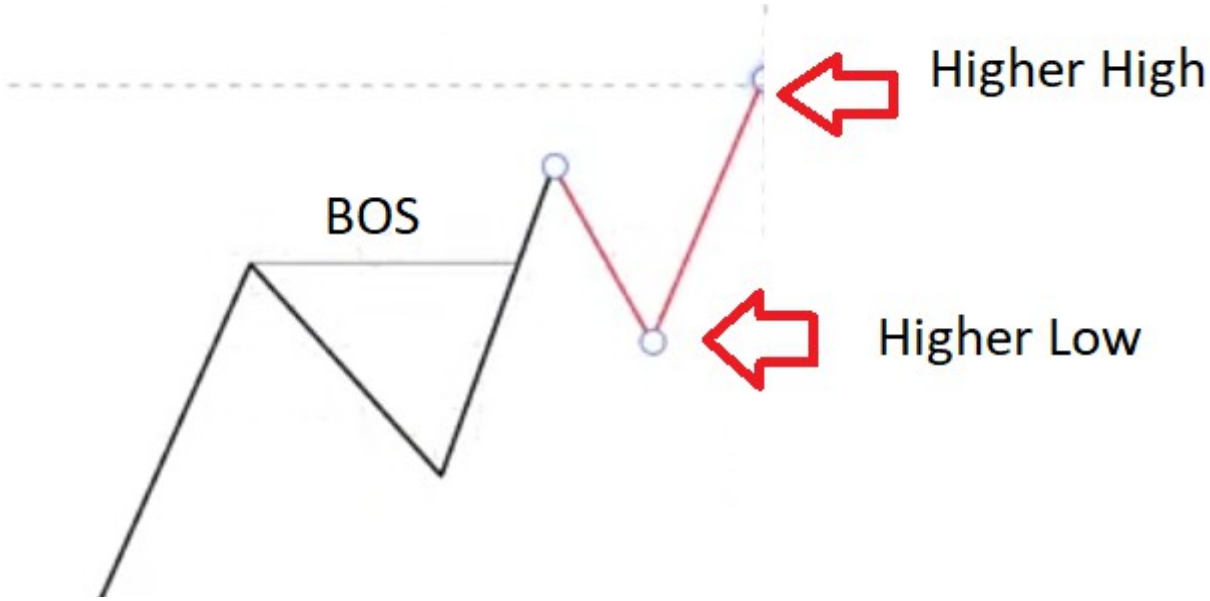
So the market structure high is the highest point price went to in between the time our low was being created and our low being touched again.
Obviously these above drawings of the market structure pivots points are all following the 6 candle rule. The 6 candle rule is always applied when drawing structure.

So now we know how to draw our market structure with the 6 candle rule and we also know how to find our market structure low and market structure high.
Break of Structure or BOS – Is simply when price has a closing price above our market structure high. The moment when price has a closing price above our market structure high that is when we can call it a BOS.

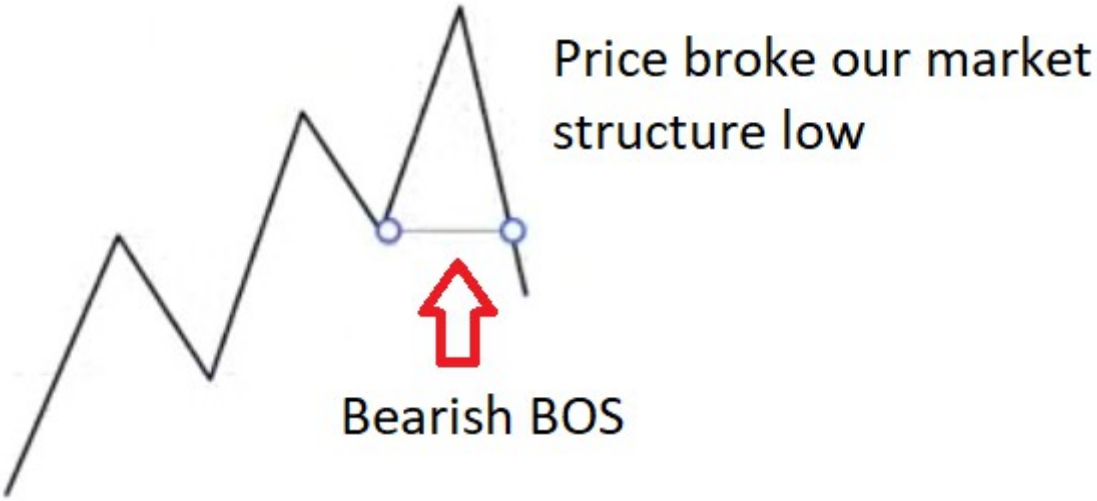
and when price is trending up like we can see right here:



and we are breaking our market structure high; expectational order flow will be a higher low for a higher high and expectational order flow is a very fancy way of saying "what do you think price will do next".



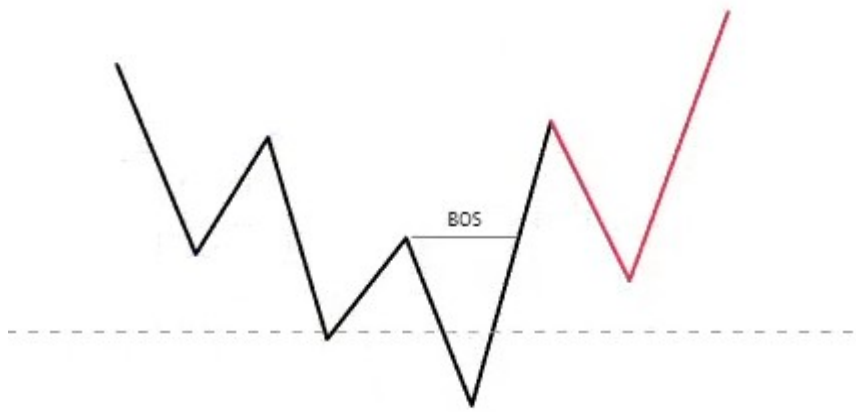
So when we are breaking structure and having higher lows and higher highs we can expect price to continue this effect. However when we are trending up and we break our market structure low right here:



and this indicates a shift in trend and now expectational order flow becomes a lower low for a lower high. When we are trending down and we have a Bearish BOS expectational order flow is still a lower low for a lower high:

If we are trending down and price has a BOS on our most recent high than expectational order flow would be a higher low for a higher high:

Which indicates a shift in trend:



Here is an example of actual drawing on BTCUSDT 3 Day time frame Bullish BOS instances:

Here is an example of a Bullish Trend on the 3D timeframe being shifted to Bearish Trend:

Moving forward on the same 3D BTCUSDT we get a retest of the previous market structure low and it returned a SFP:

Next we have an example of what looks like valid structure but is not:

Here is why:
Valid Bullish Structure:
L → H → HL → HH ✅

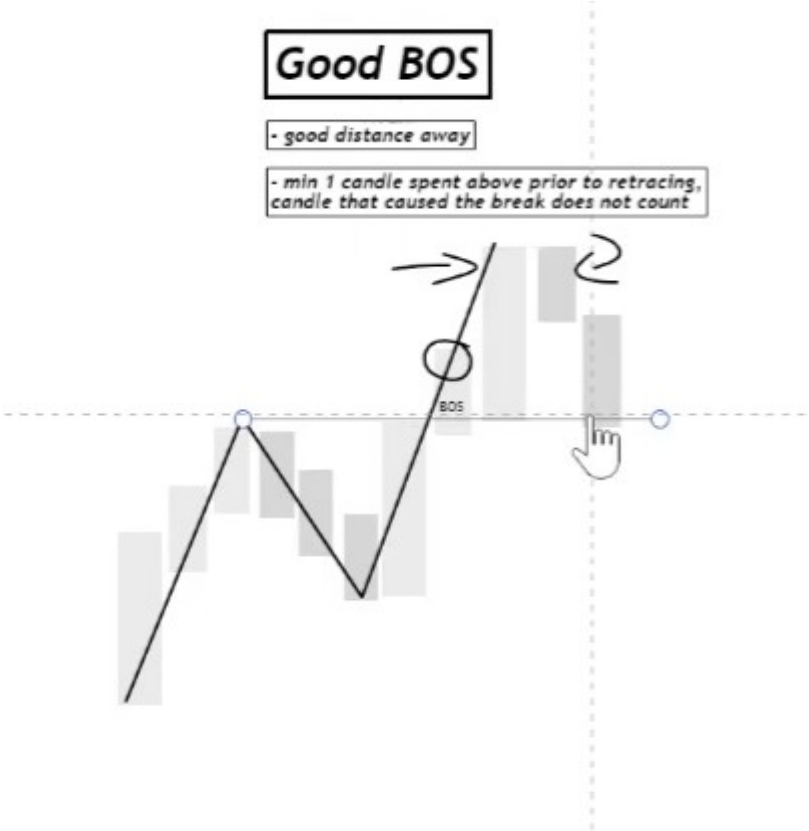
Invalid (your example):
L → H → HL → small BOS but no HH ❌

This may look like valid structure on a lower time frame too. Here is where we found the valid market structure because it has a higher high and lower low after the Bullish BOS:

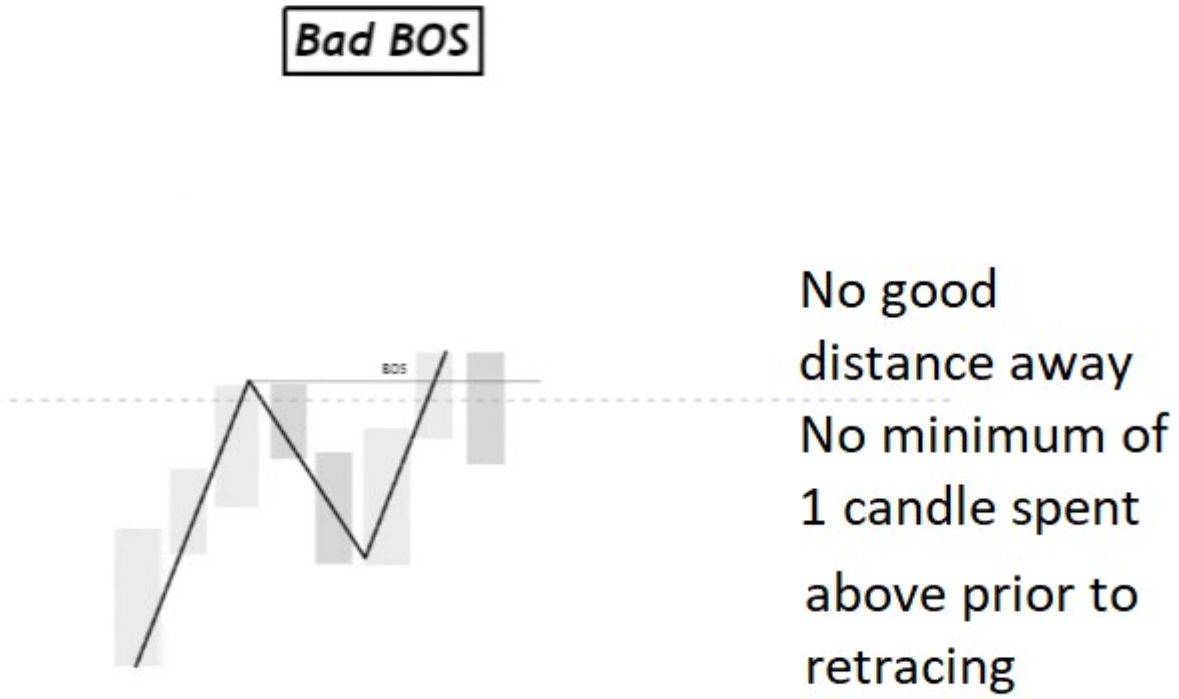
by just understanding Market structure because if you understood this uptrend and the fact that this uptrend changed right here in April 2021 you could have sold your positions and right here(see screenshot below) when you broke back to bullish you could have bought your positions back and the moment you broke back to bearish you could have sold your positions again so just by understanding structure and you apply it on the high time frame you could have sold right here (see screenshot below)bought back right there(see screenshot below) and sold right there(see screenshot below) three trades and you absolutely nailed the previous cycle.

See how crazy effective this is guys by just understanding the structure and applying the six candle Rule and when something becomes your Market structure low and then what you can expect after a bearish break in an uptrend and a bullish break in a downtrend it's so effective guys it's so effective okay so practice this for yourself practice drawing your structure applying the six candle rule

knowing when something becomes your Market Structure low or your Market structure High seeing those shifts in Trends and what follows afterwards and this applies on all time frames I'm just showing you right now on the high time frame okay now there is a difference between a good break of structure and a bad break of structure okay so in order to have a good break of structure you want your break to have some good distance away from your Market structure high.



okay now there is a difference between a good break of structure and a bad break of structure okay so in order to have a good break of structure you want your break to have some good distance away from your Market structure high so we can see right here this is our Market structure high and right here we can see two aggressive expansion candles breaking structure where they have a good distance away from our Market structure High the other requirement is that we have a minimum of one candle spent above our Market structure High prior to retracing and the candle that caused the break does not count so we can see right here that we're breaking structure on this candle and then we have one candle right here and then two candles prior okay prior to coming back below our Market structure high right here so we have good distance away and we spent one candles and two candles above it prior to retracing indicating that this is a good break of structure.

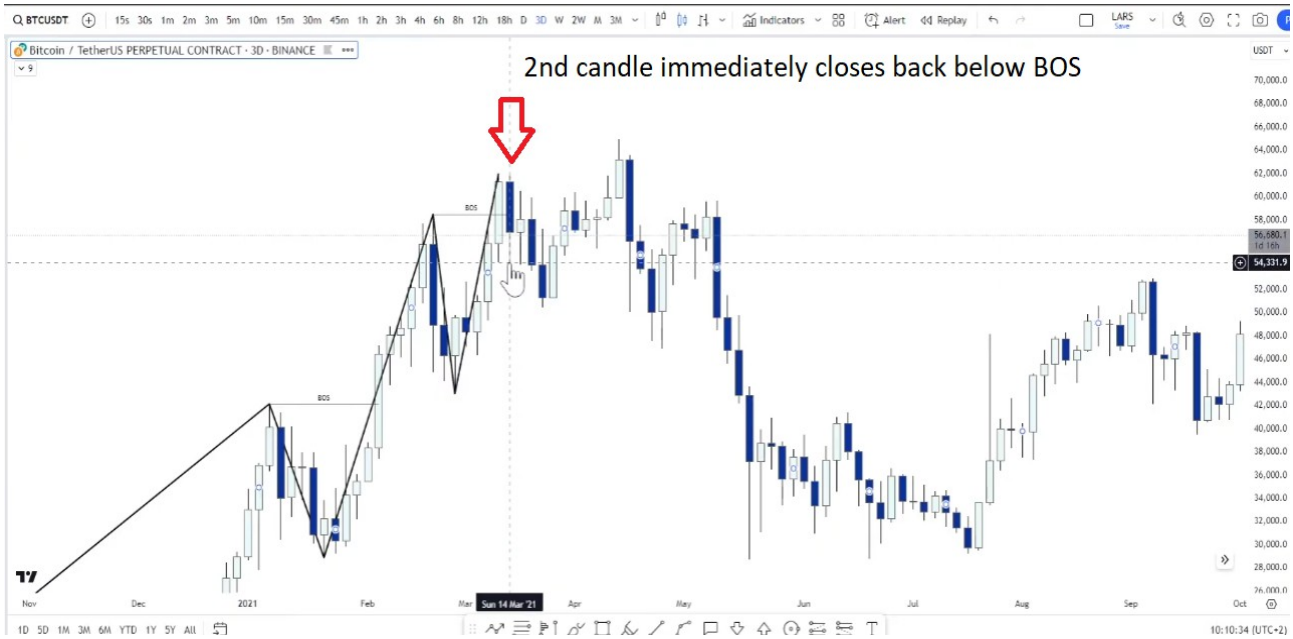


right here okay we can see that we have no good distance away from our Market structure high if you compare it to the previous picture I just showed you guys and we have no minimum of one candle spent above our Market structure High prior to retracing because the second candle immediate immediately closes below our Market structure High okay so a good break has a good distance away from a market high and multiple candles closed above it with a minimum of one a bad break of structure has a candle close above it and a second candle immediately closed back below with no good distance away and whenever you have a bad break of structure I would be very careful with calling for a higher low for a higher high when you're trending up because the break is not that convincing when you have a good break it's very easy to call for a higher low for a higher high okay when you have a bad break you need to be a bit more careful with calling that order flow objective.  And you can see that in the 3D timeframe chart:

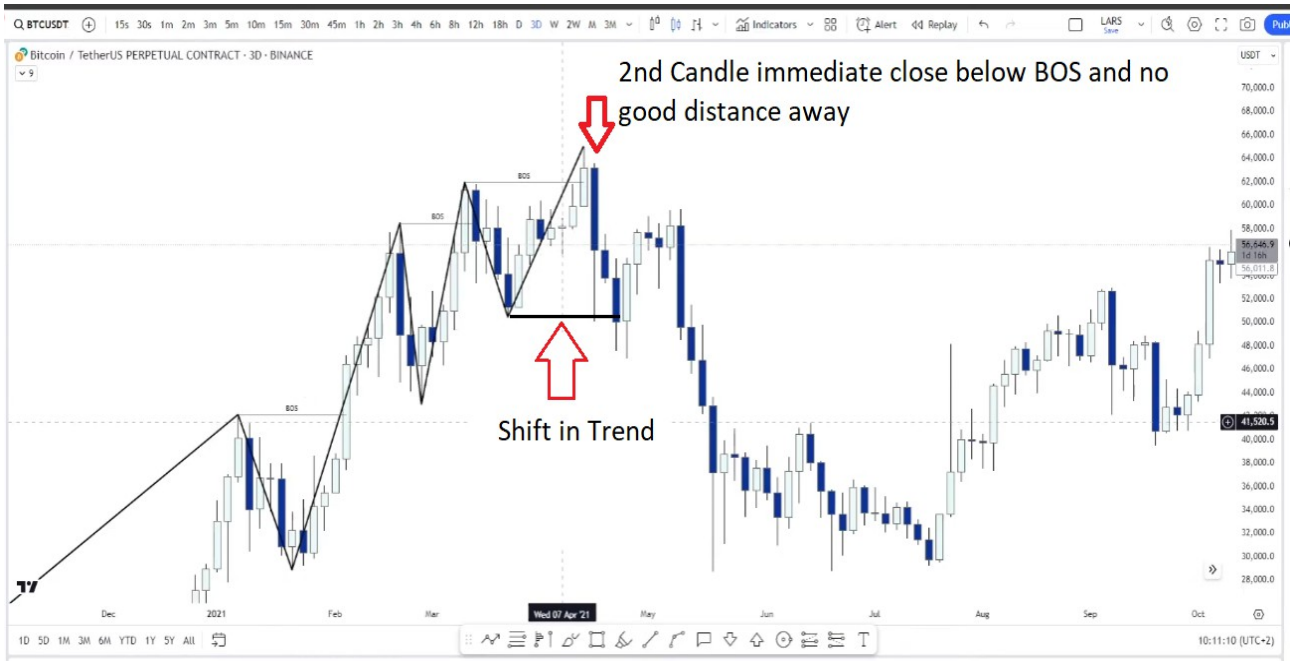
and you can also see that in the chart right so right here when we were drawing our structure this right here is a very convincing break of structure okay this right here we can clearly see that we have multiple candle closes above it prior to retracing and we never even retrace below our marker structure low so it's a very aggressive expansion towards the upside.

but and we can see that change right here

so when we keep on drawing we can see that this High was a break of structure but we can see that the second candle okay immediately closes back below it immediately closes back below

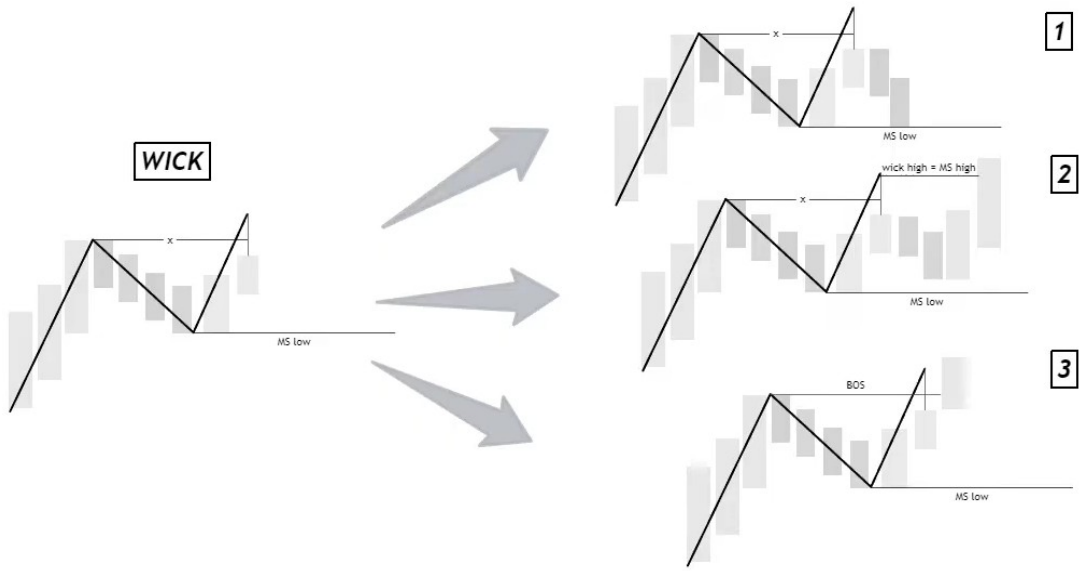


so this is a very sketchy and not good break structure so I would be very careful with calling for a higher low for a higher high yes it did happen this time and later in the video we're going to talk about how you can know if it's going to happen or not but I would be very careful okay because look what happened afterwards right here we got back to back breakup structures where there were no good breakup structures because also here we have one candle closed above it and the second candle immediately closed back below with no good distance away and what can you see well right here is where the shift in Trend occurred

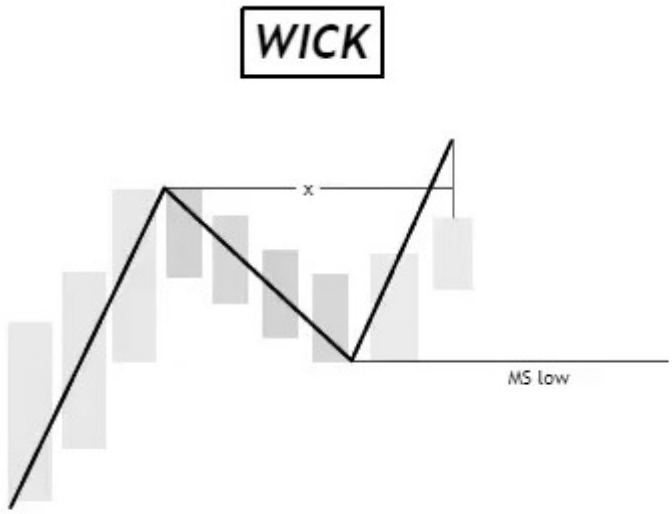


where you didn't have that higher low for the higher high but but you had that lower low okay so this is a very good breaker structure and with much conviction can you say okay we can expect a higher low for a higher high but then the moments you don't have it you be very careful because you can see that sooner rather than later you're going to have that shift in Trend. Break of structure guys absolutely key in our game of trading.

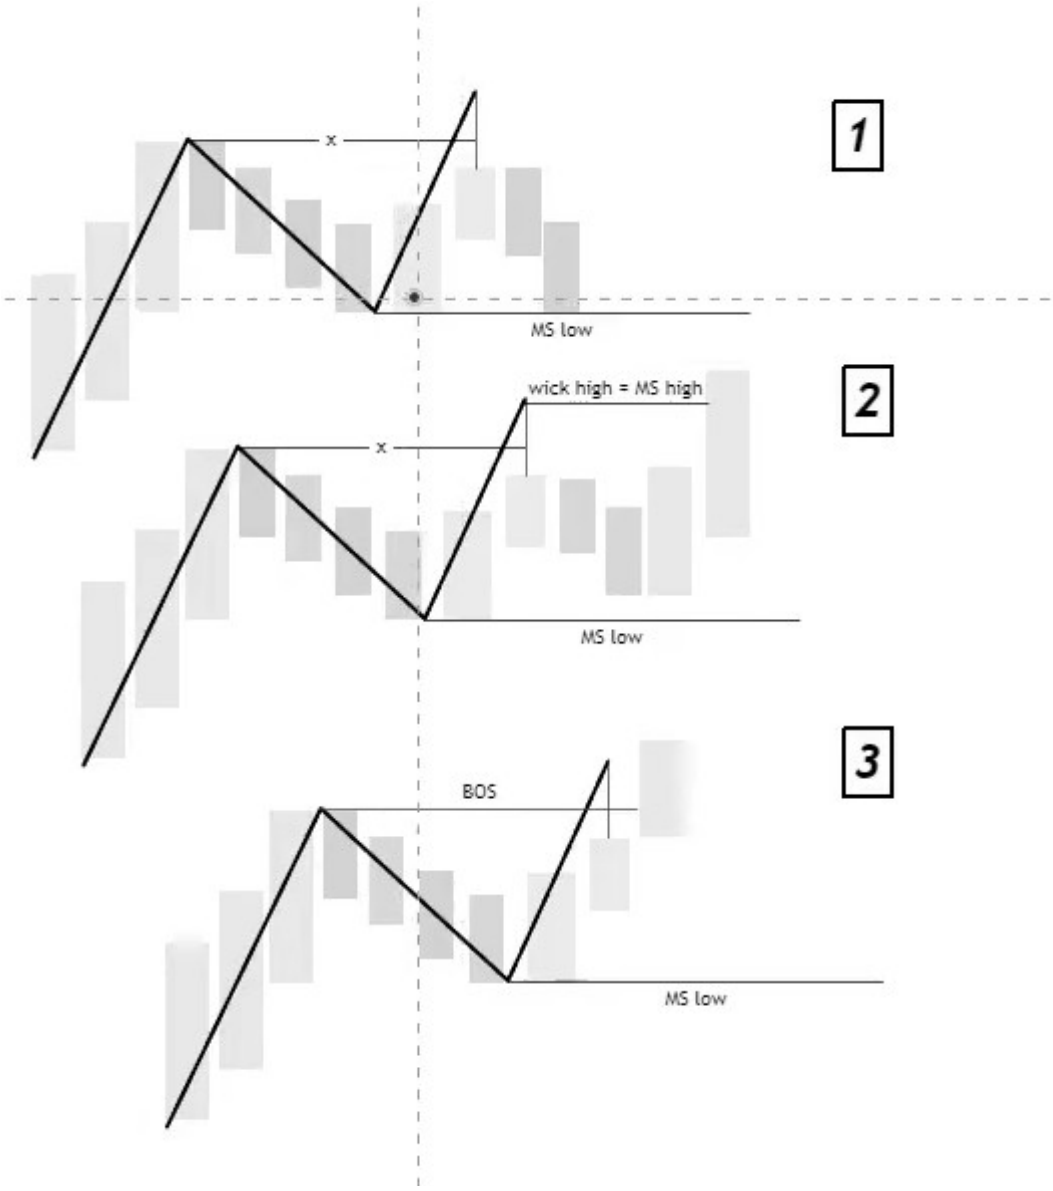
Now besides a breaker structure we could also have a wick. A wick is when price takes your Market structure high or low but it fails to have a closing price above or below it.



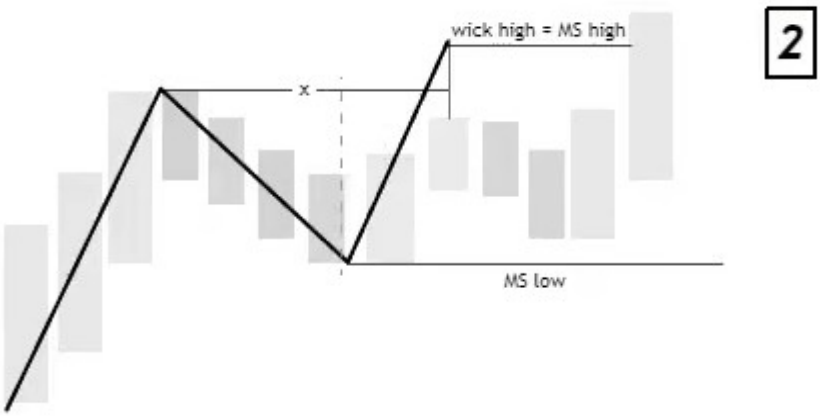
Okay so we can see right here that price is trending up obviously the six candle will applies we touch the high so this becomes our Market low but we do not have a closing price above our Market structure high right here no we exceeded but we close below it causing us to Wick the high.



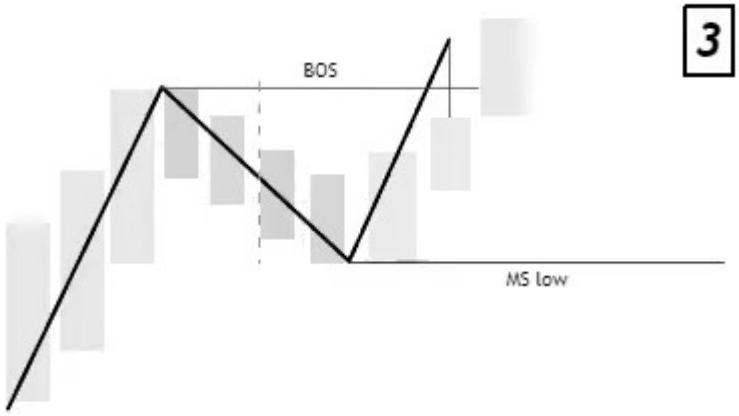
and some other people like to call it a swing failure pattern an SFP okay now an SFP makes the other low weak in nature what do I mean with weak well the job of the low in an uptrend is to take out the high and to close above the high when we Wicked we failed to close above our Market structure high and we could have a rotation back down towards our Market structure low and it's the other way around when we're trending down so when we're trending down and we fail to have a closing price below our market structure low the high can become weak and we could have a full rotation back up towards that market structure high but in this example back down towards our Market structure low so after a wick there are three scenarios that can appear okay there are three scenarios that can happen



we could have a full rotation back down like you can see in scenario one okay so we're trending up we're wicking the high and we could have a full rotation back down towards our Market structure low. In scenario two:



we can see that we are wicking the high we're getting a reaction away from it but we do not come for a market structure low and we do put in a higher low for a higher high and in those scenario where we do get the reaction away from it that is when our new Mark structure High to break becomes our Wick High okay so when you get that reaction away from it we just change our new breakup structure level to the wick high so the wick High becomes our Market structure High okay and we just continue drawing our structure like this but we cannot call a break of structure until we close above our Wick High.  The third scenario:



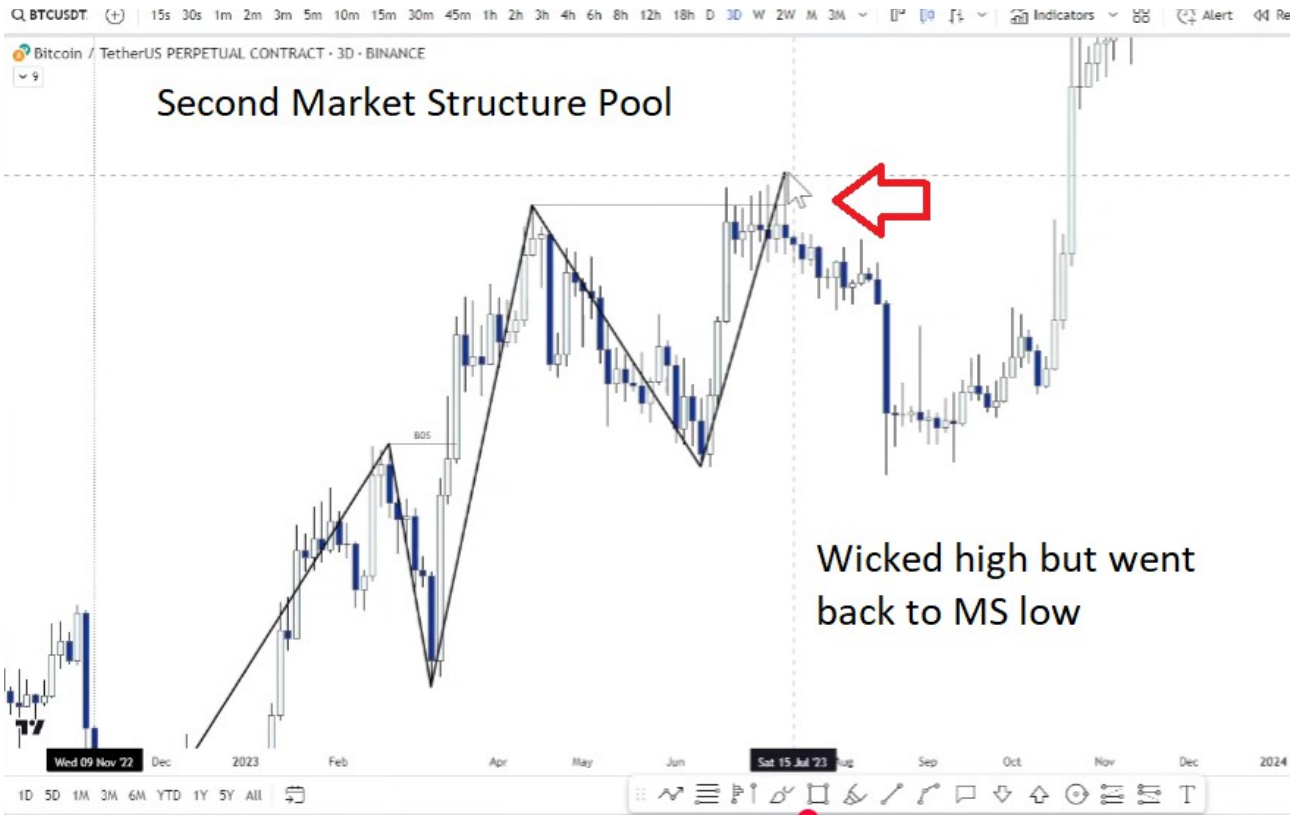
is just when we Wick our Market structure high right here but then the second candle immediately closes above it and that is when you still have a break of structure so we Wick our high scenario one we could have a full rotation back down towards our Market structure low scenario two we get a reaction away from it but we do not come for the low and we still put in a higher low for a higher high but we can only call a break of structure when we close above our Wick High third scenario the first candle wicks but the second candle immediately Closes above it and then we still have a break of structure.  So we Wick our high scenario one we could have a full rotation back down towards our Market structure low scenario two we get a reaction away from it but we do not come for the low and we still put in a higher low for a higher high but we can only call a break of structure when we close above our Wick High third scenario the first candle wicks but the second candle immediately Closes above it and then we still have a break of structure and we can actually apply this to the chart(below)  and a very key example was right here okay from our bear Market low right here we were trending up okay we were having higher lows and higher highs:

okay and right here(above screenshot) we had a higher low for a higher high

but what we can see is instead of closing above our high like we did right here is actually two perfect scenarios back to back so right here(above screenshot).

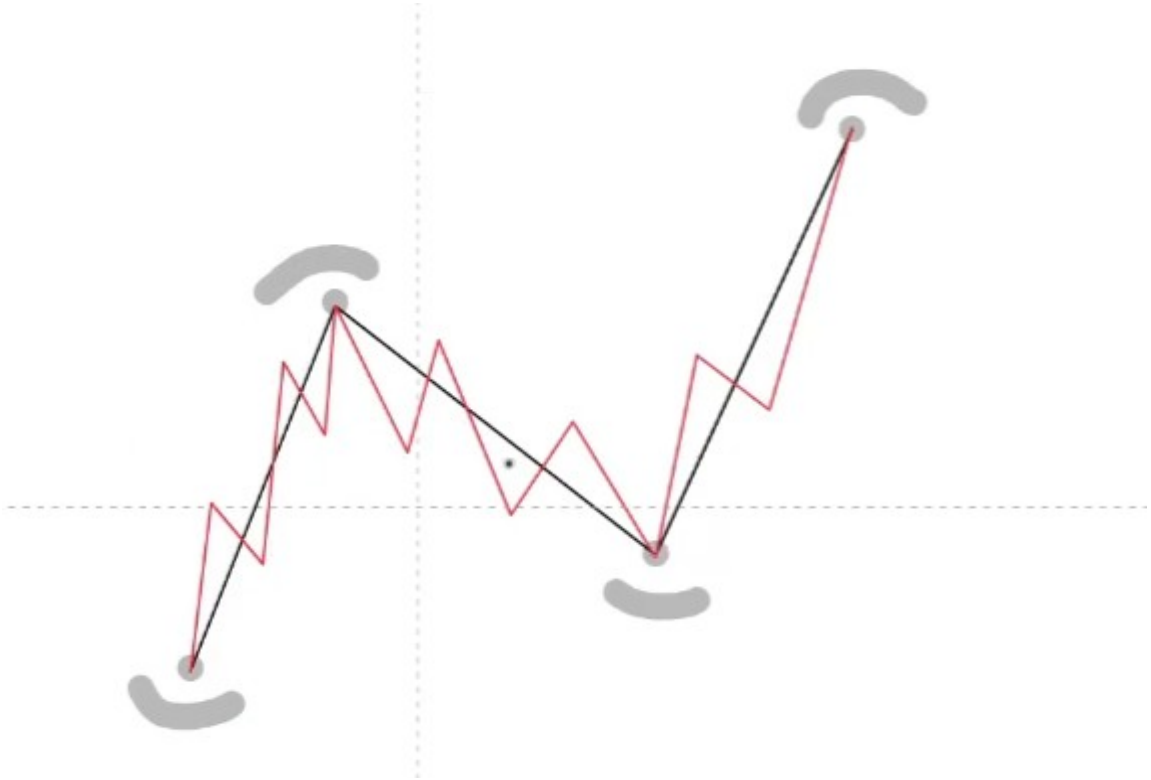
in our first Market structure drawing okay we Wicked the high but the candle after we immediately closed above it so in this scenario we can still call it a breaker structure okay

but in the second Market structure pool we Wicked our high and look what happened price came back down for our Market structure low but then look what happened we Wicked our Market structure low so now price could have a full rotation back up towards our Market structure high right and this becomes our new break of structure high and right here we have a closing prize above it

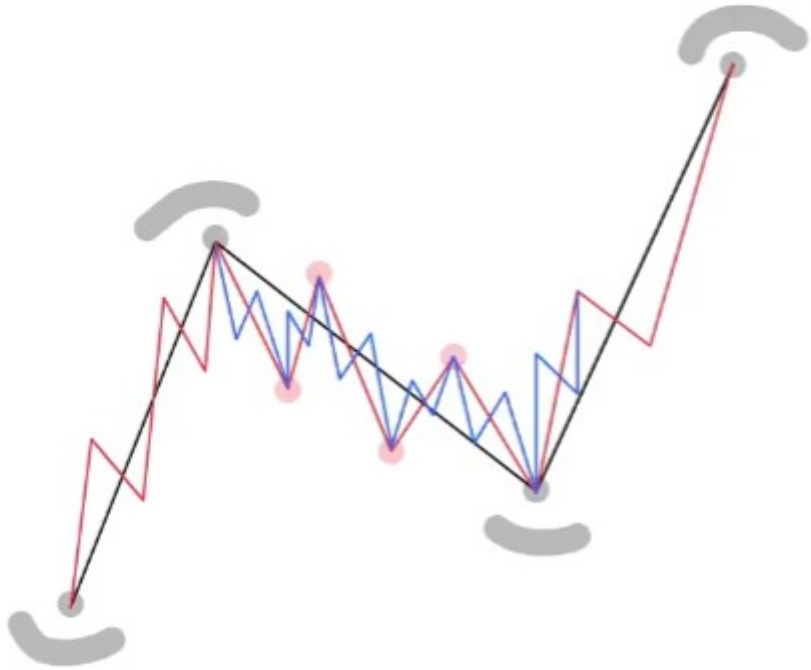


so while other people may call this a downtrend where you know it's a lower low yes it is a lower low technically speaking but it's a wick so you can see it right here we Wick the high and the low becomes weak and we can have a full rotation back down towards our Market Structure low and then when we have the full rotation back down we wick the low and now the high becomes weak and we can have a full rotation back up towards our Market structure High. Okay so when we have a wick it's not a break of structure and they are two very very different things that's very important to understand because a lot of people misuse Wicks okay and they are calling it Market structure breaks it's not okay a wick is actually making the other Market Point weak in nature. okay now to determine guys to determine which on of the scenarios is going to take place regarding the Wicks we have to understand different levels of Market structure we have different levels of Market structure and this is the most important part of this tutorial to understand okay and it's also more advanced but once you understand this you'll become a master in already predicting where the market is flowing okay depending on the time frame that you are on you will have different levels of Market structure okay and it is important to understand that the higher the time frame the structure the more important and significant it has.

so let's say we have a high time frame uptrend okay let's say we have a high time frame uptrend and we have a higher low and a higher high and we can say that our black market drawing represents our daily time frame okay so this is our daily time frame where right here we have those pivot Points of a low and a high and a higher low and a higher high and this also follows the six candle rule obviously so we have a daily uptrend guys well I told you that prices do not go up in a straight vertical line and in order okay in order to get from point A to a point B to a point C to point D you need to move up down and up but prices do not move up in a straight vertical line and we're on the daily time frame right now so what you will see when you go down to the 4H hour you'll see actually some sort of an uptrend inside of your daily time frame which will look probably something like this



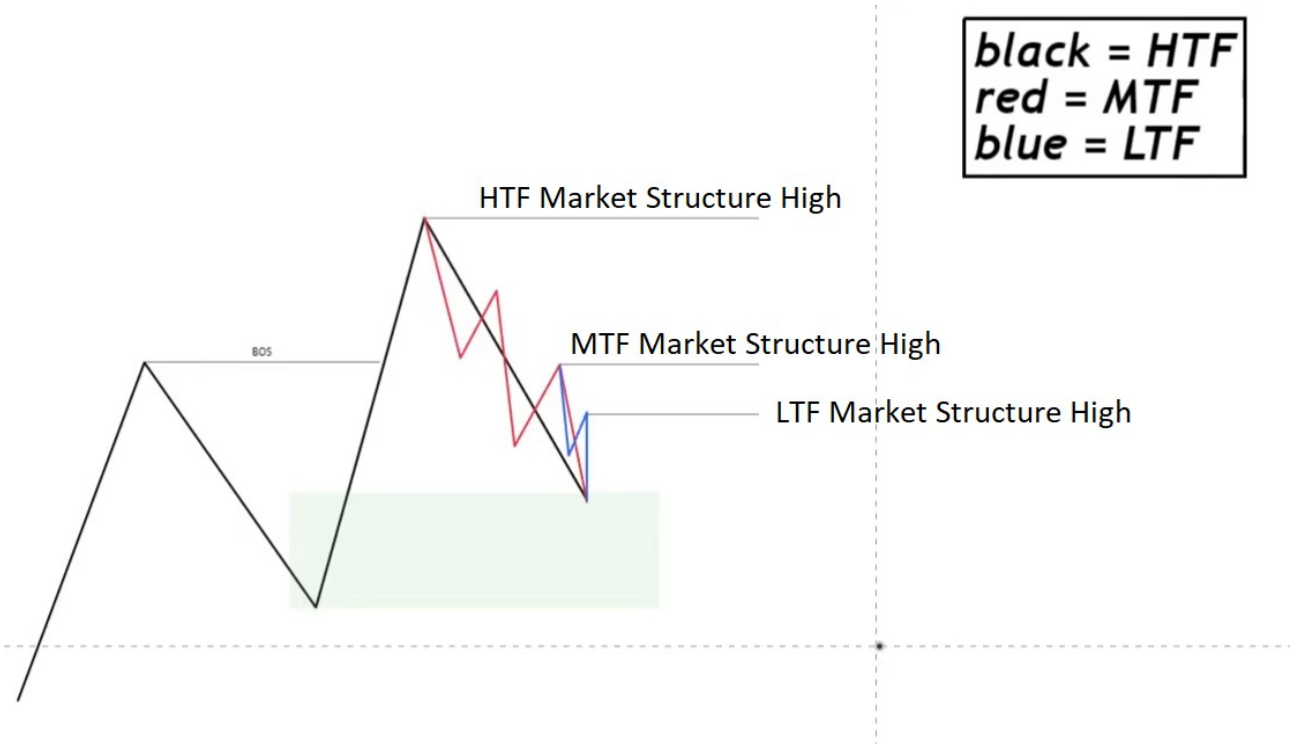
and we can make that red okay because in order to get from point A to point B prices need to go up and maybe on the daily time frame it will look like just one move up but on the 4H hour time frame okay you'll actually have some zigzag patterns AKA market structure so your 4-Hour time frame has some structure inside of your daily structure okay overlapping structure but we can dissect it down even more so if we're just looking at the pivot Points right here on the 4H hour we know in order to get from point B to point C prices need to go down okay on the daily time frame that may seem like one move down if we zoom in on the 4 Hour we can actually see some sort of structure but we could also zoom in on the 30 minute and on the 30 minute you may actually see some structure inside of your 4 hour structure looking something like this(screenshot below):



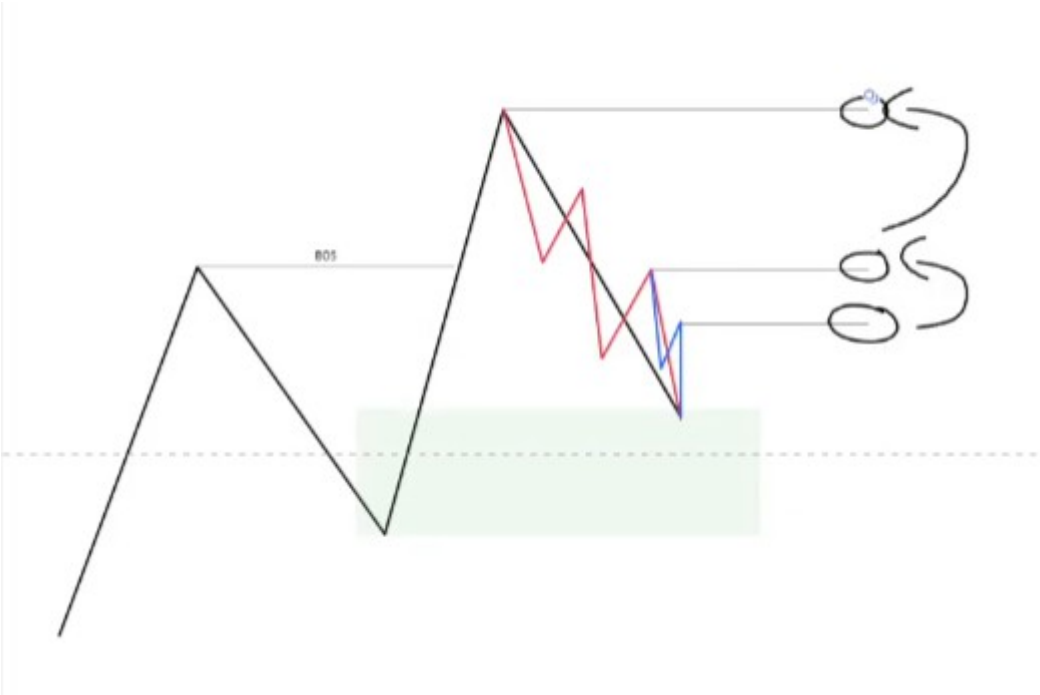
let's make that blue(blue pivots above represent 30 minute market structure) because in order to go down right here you know to have this 4H hour I'm looking at my red markers(red pivot points above represent 4 hour market structure) you're drawing right now in order to go down on the 4 hour it may seem like one move down on the 4 Hour but on the 30 minutes you may actually have some structure that you can look for and I always boil it down to three structures okay where our black is our high time frame market structure(black pivot points above represent HTF market structure) red is our mid time frame structure and blue is our low time frame structure okay and it's very crucial that you guys understand that the higher the time frame the structure is the more importance and significance it has okay however the high time frame is the most important but the low time frame breaks start the high time frame pivot Points and using and paying attention to all of them allows you to never get trapped so how we can use this overlapping structure to our advantage.

well let's say prices are trending up on the high time frame let's make that black black is our high time frame okay so let's say prices are trending up on our high time frame we have that breaker structure and we're actually coming into an area of significance okay cuz right here we have a support Zone we have some demand now we know okay we know that our black in this case represents for example our daily time frame okay if we zoom in on the 4our we may actually see some structure inside of this daily downtrend local downtrend okay because we're trending up on the daily but from top to bottom we may actually see some 4H hour structure and when we zoom in looking at this last expansion towards the downside on a 4H hour time frame we may actually have some 30 minute structure like this let's make that blue okay so right here is our blue Market

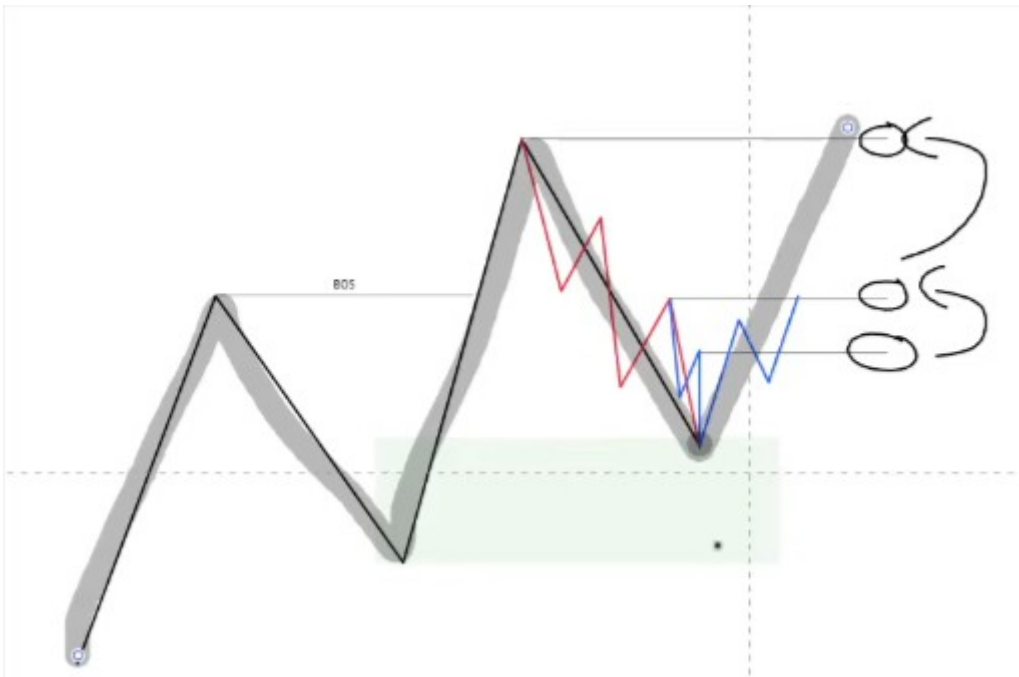
structure high right here is our red Market structure high and right here is our black market structure high:



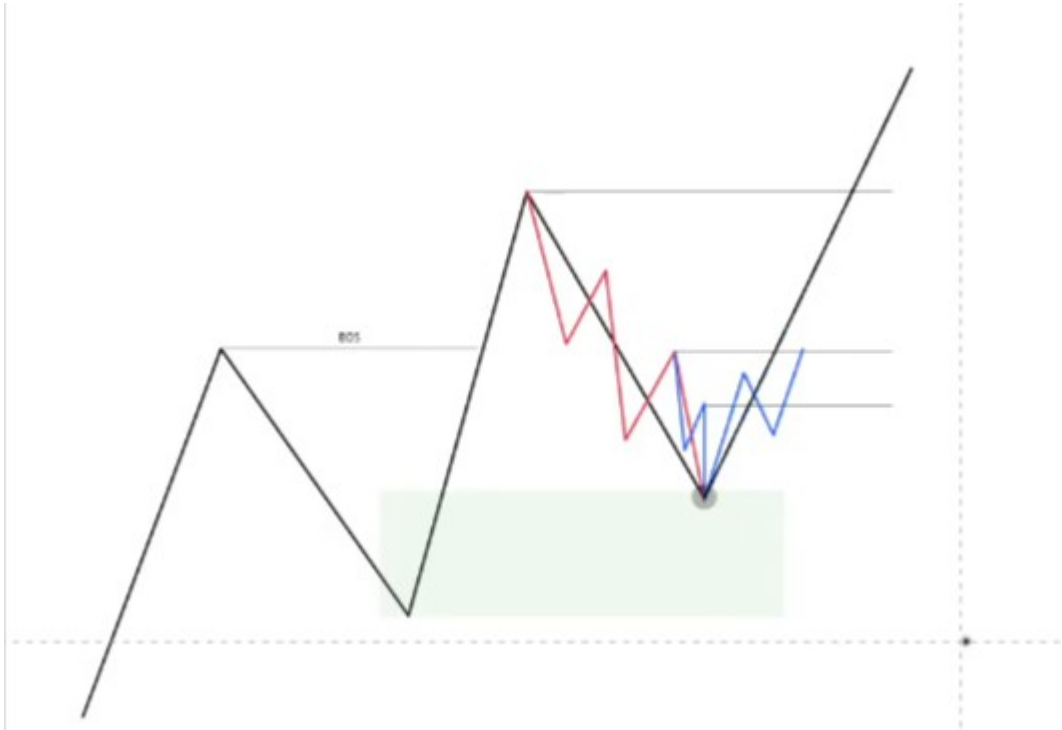
and how we can use this knowledge to our advantage is something I call the domino effect okay it's something I call the domino effect and what the domino effect means is that the moment we break our blue marker structure drawing back to bullish that could mean a rotation towards our red Market structure high and when we break our red mark structure high back to bullish that could confirm a rotation towards our black Market structure drawing High



the domino effect you break blue you move up to Red you break red you move up to Black And now when we break our blue markers are drawing back to bullish and we can expect a higher low for a higher high to our red we can already expect not confirm but expect that this could be our it point and our Market structure low on this massive High time frame move just like this

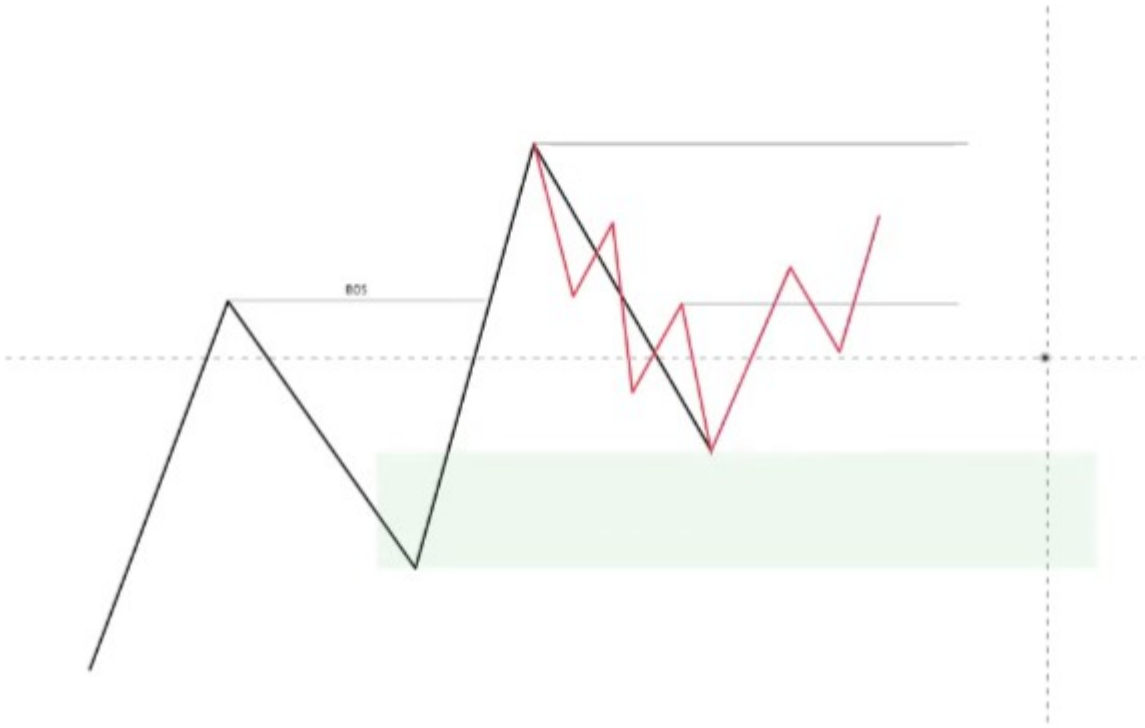


by watching our 30 minute structure we could potentially already confirm this uptrend that's going to continue itself which is absolutely crucial because you can already find local entries having a good bias okay so it's crucial that you keep this in mind black is the most important and that's your high time frame red is your second most important that's your mid time frame and blue is your least important your low time frame but in order to get a pivot point on your high time frame you need the low time frame breaks that is what I was just referring to that the high time frame is the most important but the low time frame breaks start the high time frame pivot Points because let's say this did happen where our black market strcture drawing and continued itself

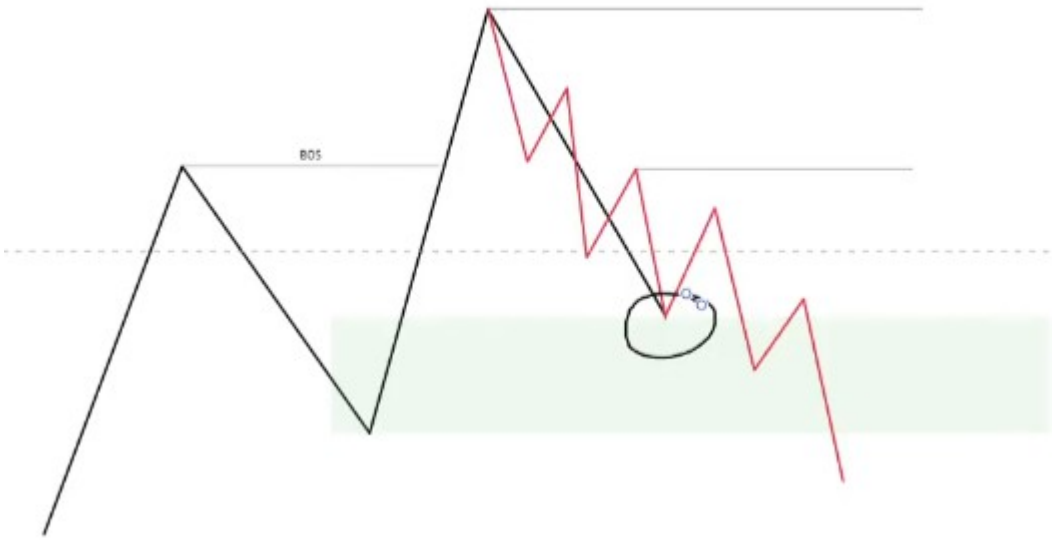


okay well then blue and red must have broken back to bullish but we can already determine and expect a potential High time frame pivot the moment we break that low time frame downtrend from top to bottom okay and not only does it allow us to expect potential pivot Points already on the high time frame by looking at the low time frame breaks it also allows us to stay out of potential fake Break of structures

okay let me elaborate we're coming into that area of support okay we know that if we break our red Market structure drawing okay we know that if we break our red Market strcture drawing back to bullish that can confirm um or that can confirm our expectation of having that high time frame pivot and that high time frame higher low for the higher high using our black market strcture drawing so what we can what that allows us to do is we can just wait for our red to break back to bullish okay and then long the retracement up towards our black high (see screenshot below)



but what happens okay what happens if your red never breaks back to bullish if your red never breaks back to bullish and you just continue downtrending and you take the low well you would have never even longed the higher low because you were waiting for your structure from top to bottom on the lower time frame to break back to bullish



if that doesn't break back to bullish you're never going to get your pivot point on the high time frame so knowing these overlapping structure rules you will never get trapped okay you will never get trapped into longing a higher low because you can wait for the confirmation from the low time frame structure from top to bottom and if that doesn't break the bullish you don't long the higher low okay you don't long the higher low because sometimes it happens that you have a fake break

when your break of structure is not good like we just discussed earlier in the mentorship bad breakup structures no good candle closes above no good distance away.  well if you have no if you don't have a good break of structure and you see a downtrend on the lower time frame and that doesn't break back to bullish you never long the higher low so let's apply this knowledge now the domino effect and the way you can stay out of Trades to the charts.  I'm getting excited here you know this information is so good okay you literally you'll be the you'll be the best swing Trader that is out there by just understanding these Market structure rules. okay let's apply it to the Chart guys let's apply it to the Chart so I'm going to use that same structure drawing okay going to use that same structure drawing.  we had that higher low and that higher high okay well let's look okay let's look at these pivot Points on the high time frame let's make this black because we were just referring to black as our high time frame these is our our pivot Points:

let's get rid of this drawing and let's zoom in let's zoom in I'm on the 3-day time frame right on the 3-day time frame this looks like one move down I cannot draw structure using the six candle rule inside of this downtrend:

but if I go on the eight hour look at that we can actually see some structure on the 8th hour:

so on the eight hour we have a high we have a low and we have a lower high and we have a lower low

you see that we have structure on the 8 hour that wasn't structure on the 3day (see above screenshot). So let's create these put these pivot Points on the chart let's make it red:

now let's check this last expansion towards the downside for even more structure (see screenshot below with red line for downtrend)

okay let's go on for example the 4H hour I already see some structure on The 8 Hour as well

in this downtrend that is also possible let's go on let's say the 4 hour you can kind of switch through time frames to see on which time frames uh the Market rules apply often times the four and the six and the eight it could be the same okay it could be be the same but what what we see on the four is we see a move down we see a move up and we see a move down

Low time frame pivot points in blue:

so these are our low time frame pivot Points and you determine your low time frame depending on what you pick as your high time frame okay so our high time frame is in this case the 3-day then our mid time frame might be the eight hour and our low time frame might be the you know the the 4 Hour but if you pick your your black markers are drawing as your 1 hour your mid time frame

might be the 15 minute and your low time frame might be the three okay it just depends on where you're looking at but I always boil down to you know just these three market structure pools. so what do we know okay what do we know if we break our blue Market structure High okay that can confirm a rotation towards our red Market structure high and if we break our red Market structure high that can confirm the rotation towards our Black Market structure High

well we Wicked it here first okay we Wicked it here first which is something I'm going to get into later what you can uh do when it Wicks it okay but uh if we just extended so we got the wick we got the reaction from it right we got the wick we got the reaction we got another Wick we got the reaction so in those cases where we get those reactions like we were just talking about that's when we extend our break of structure but right here we got that break of structure (see below screenshot for BOS location):

so right here we got the break that confirmed the rotation towards our red on the red we got the break and that confirmed the rotation towards the black you see how that works you break blue you go to Red you break red you go to Black.  okay let's keep on drawing not only that guys not only that the fact that we broke blue confirmed that it could be a potential Pivot Point on our black marketer drawing which was the 3-day right.  (See screenshot below)

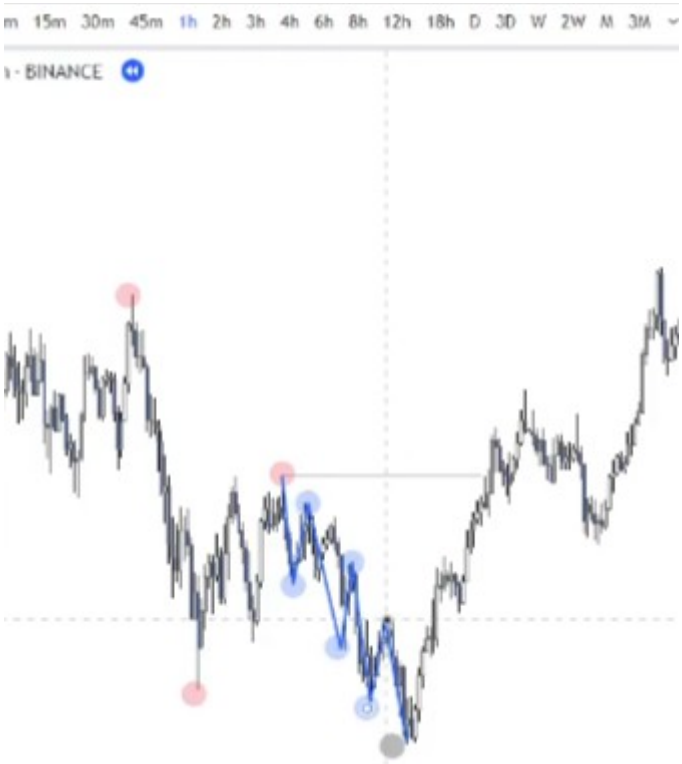
okay let's keep on drawing not only that guys not only that the fact that we broke blue confirmed that it could be a potential Pivot Point on our black marketer drawing which was the 3-day right if we never broke that back to bullish this would have never been a low and you would have never gotten trapped into thinking that this was going to be a low.  So let's continue drawing let's exit replay mode go back to the 3day right here this was our next so we had our high higher low boom let's make it black right here we had our we have right here we had that second pool:

okay with our bad break of structure okay we had that bad break of structure here:

but let's see let's see this was our high on the 3-day this was our low what's their way to confirm this potential Pivot Point using lower time frame structure let's go into replay mode and let's boil all down to8 hour structure or 6 hour structure okay let's do six these were our pivot Points if I zoom in we can actually see some structure inside of our 3day structure that goes like this:

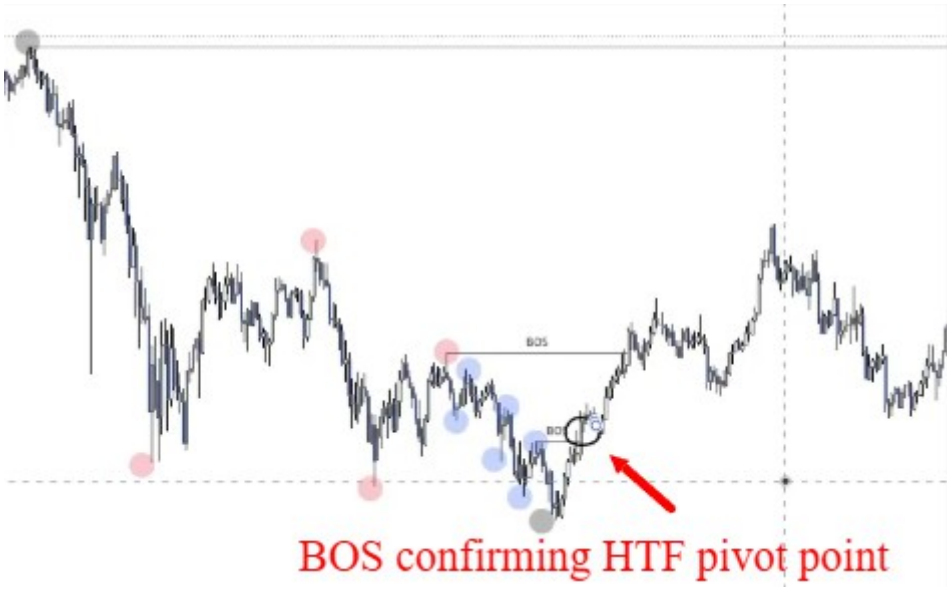
obviously applying the six candle rule and this is our 6-h hour Market structure High let's put the pivot Points on the chart low high lower high or lower low lower high lower low

let's get rid of it now let's check if we have even more structure in this last expansion towards the downside on the 6-h hour time frame and let's go on the 1 hour on the 1 hour we see structure inside of that 6h hour structure that is lower high lower low lower high lower low lower high lower low blue let's make it our pivot Points where this is your blue market structure high

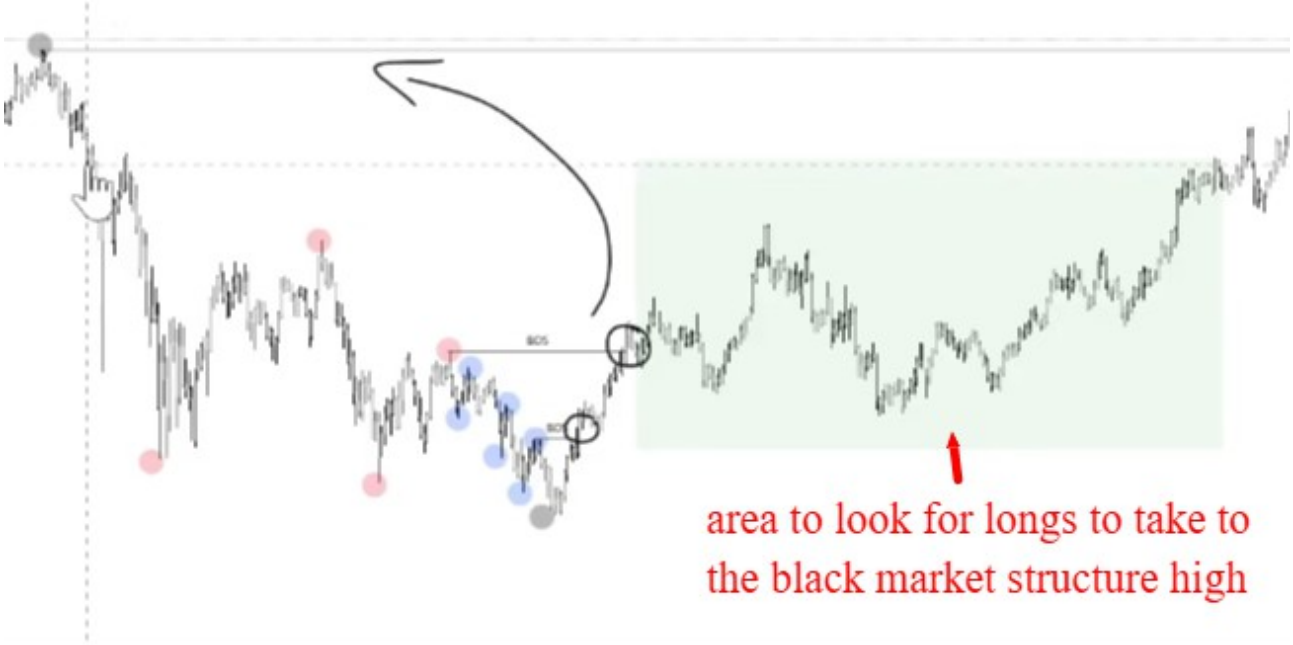


so guys what can we say using the domino effect well the moment we break our blue Mark structure drawing High we could come up to our red mark structure drawing High and the moment we break our red mark structure drawing high right here we could have a rotation to our black mark structure drawing high and you see how this played out literally to perfection

and how you could have potentially already confirmed a high time frame Pivot Point on this break alone(see screenshot below):



knowing that if you break this high right here you could have a rotation towards your red high and the moment you break our your red high you can have a rotation towards your black high and therefore you know in this entire bit of price action this entire bit of price action you could have looked for Longs and take it towards that black market structure High



because that is your orderflow objective on the high time frame see how you can build amazing context now how you can know by breaking these market structure points you can look for Longs in this entire bit of price action and take it towards that red Market structure drawing or black market drawing High because your bias is correct okay your bi is correct and you not only know that you're going to get that high time frame pivot point and the higher low for the higher high if this didn't happen if you didn't break your blue if you didn't break your red back to bullish you would have never longed it and you would have never gotten trapped into longing a potential higher low for a higher high on the high time frame because you never broke your mid and your low time frame back to bullish so it gives you an amazing way of knowing where price is heading to Next while also keeping you out of Trades if it doesn't happen properly because let's continue drawing guys let's continue drawing right here I want to show you one more

we just continue drawing we had our structure we had our high we had our higher low our higher high our higher low our higher high let's keep it black this our 3day right here we have right here we have a bad break okay right here we have a bad break this was that first bad break of structure

I was talking about so we should be very careful with longing a potential higher low okay we should be very careful with longing a potential higher low

let's zoom in let's see if there's structure inside of this downtrend on the 3-day let's go on the six hour there we go these are our pivot Points that three-day low that 3-day High let's draw our structure right here on the 6 hour let's make that our red mark structure drawing

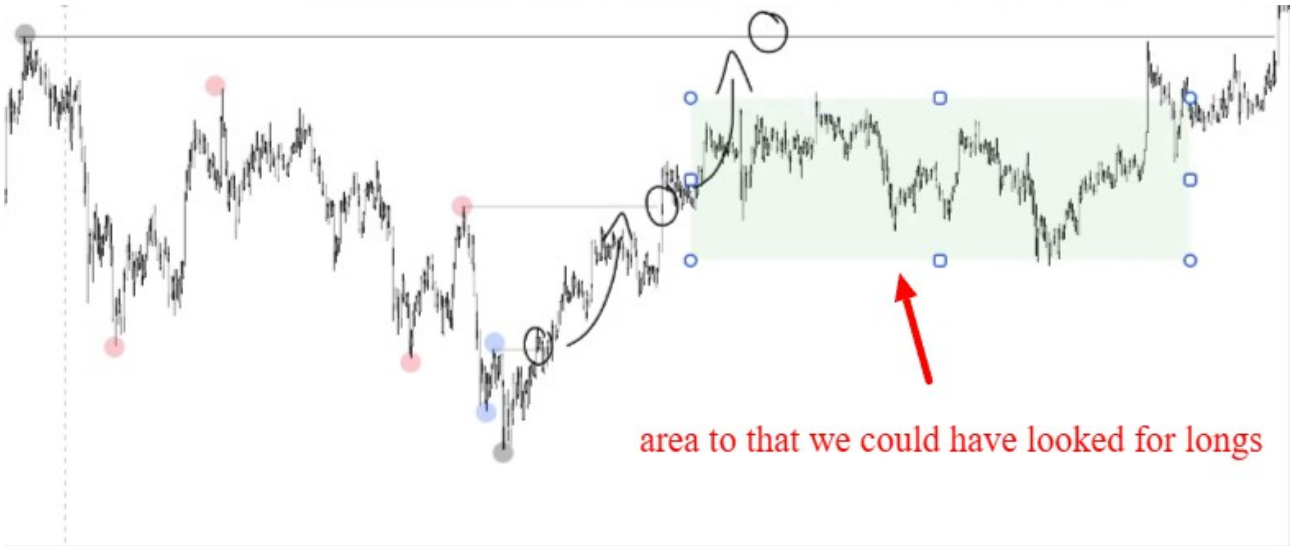
putting the pivot Points in again red red lower low lower high lower low this being your red markers your drawing high:

and then let's zoom in to see if we have structure inside of this last expansion towards the downside on the 6 hour to see if we have even lower time frame structure let's go on the 1 hour okay and you can just flicker through the time frames to see what price gives you maybe it's 1 hour structure maybe the one and the 2 hour is the same we can see right here on the one now we have a low lower high and a lower low

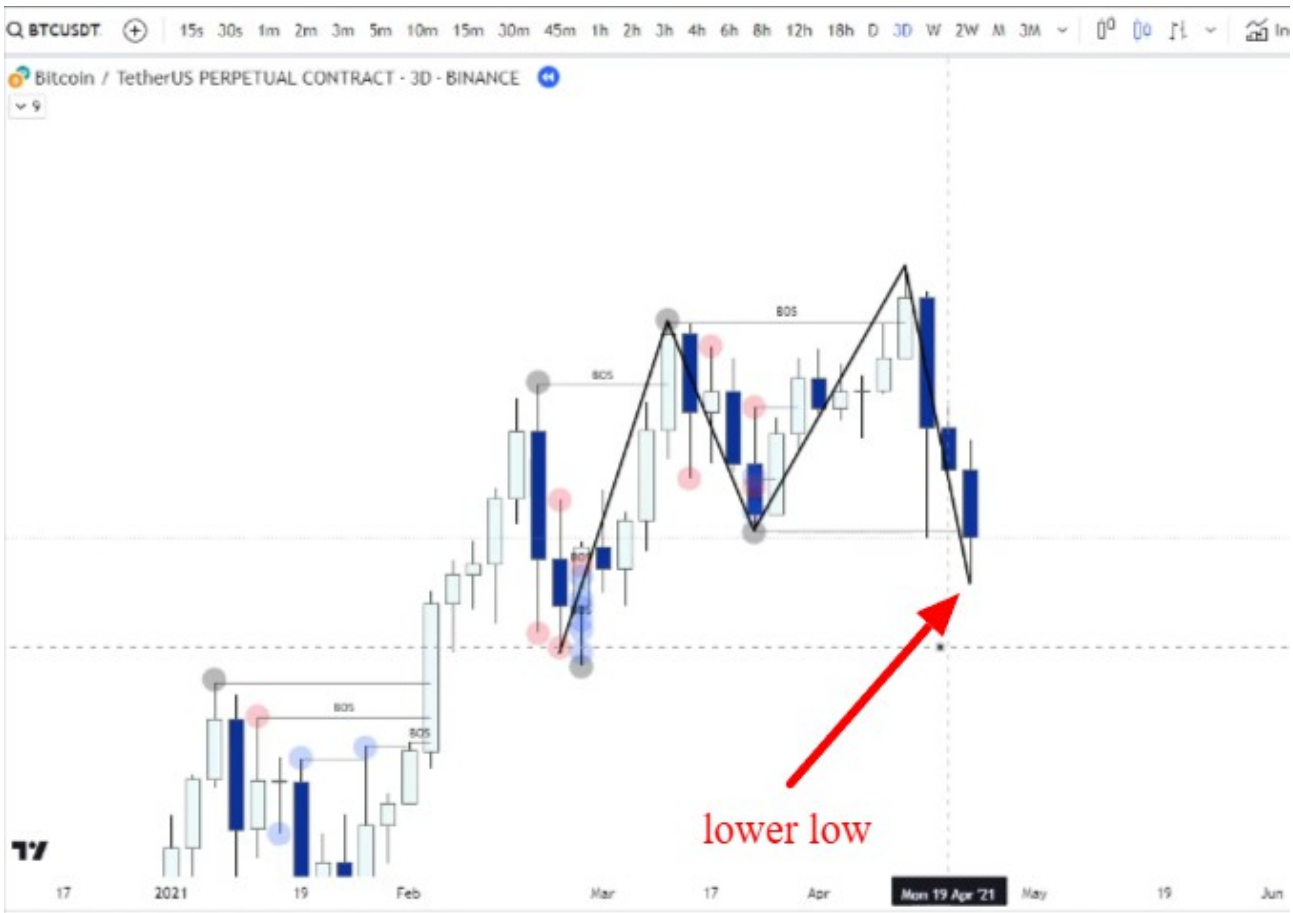
putting the pivot Points in there you go let's apply the same effect the domino effect

okay if we break our blue Mark structure drawing high that can confirm a rot rotation towards our red marker structure drawing high and if we break our red marker structure drawing high that can confirm the rotation towards our black mark structure drawing high if we never break blue and if we never break red back to bullish you will never get a higher low because we were very careful with longing a higher low because we had a bad break of structure but you can see right here that you break your blue back to bullish and you get the rotation to red and you break your red back to bullish and you get your rotation to Black confirming that this could potentially be that higher low and that this can be that high time frame pivot point and we kind of come back to that high even though the break of structure was not that good even though the break of structure was not that good okay so it gives us that reconfirmation that reassurance of like okay we did have a break of structure but the break of structure was not the best okay so we just wait to see if we can get a reconfirmation and we can wait for our mid time frame and low time frame structure you know to give us any signs of strength by breaking back to bullish confirming those rotations up

again giving you a bias that you know in this entire bit of price action you could have looked for longs to take towards that black market structure drawing High now let's look at that last expansion



okay let's look at that last expansion because you can see the difference with what I mean with the reassurance that you can get because right here we had yet again a bad breaker structure okay and what followed was not a higher low for a higher high but what followed was a lower low okay what followed was a lower low right here(see screenshot below):

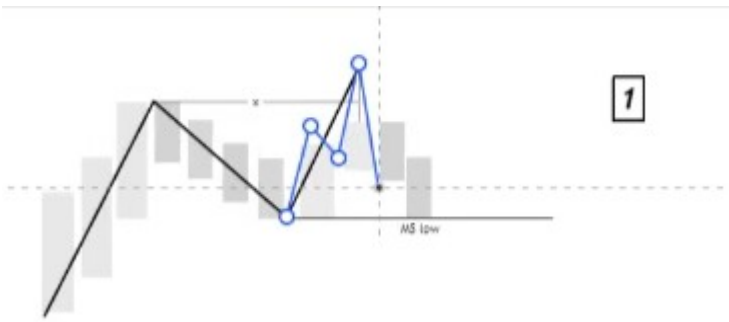


well knowing the domino effect and knowing that we can just wait for a break of structure on the lower time frame to break back to bullish to confirm the rotation to the mid time frame and the mid time frame to break back to bullish to confirm the rotation to the high time frame you know in that flow formation if that doesn't happen we're never going to Long any form of a higher low okay and if we check guys between our high and our low on the 3-day let's see if we would have gotten trapped let's go on the 6h hour time frame we can do the four to have a bit more structure there you go well you can clearly see that your mid time frame structure had a lower high and a lower low and a lower high and a lower low bring the pivot Points in the chart right these are our pivot Points we can disect even down

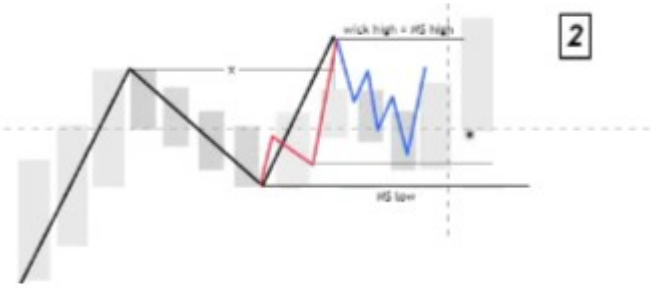
let's check if we have structure inide of this expansion towards the downside on let's say the 1 hour yes on the 1 hour we have a high lower lower high lower low so make that blue right here put the pivot Points in the chart look at that do you see how your mid time frame was trending down and your low time frame was trending down and you never confirmed any break back to bullish you never broke your mark of structure High confirming a rotation to your mid time frame Market structure High confirming a rotation towards your black market structure High you never broke that high so you would have never gotten trapped into thinking it was going to be a higher low because you can wait for your structure from top to bottom to break back to bullish it works so good guys it works so good and it works the exact same in the downtrend I showed you the drawing example um um I showed you the drawing example while uptrending actually but it works the exact same way in a downtrend confirming a lower high for a lower low

okay but do you see let's exit replay mode do you see guys how how these markets flow how the way of looking at the chart using proper Market structure and proper breaks and the domino effect and the reconfirmations that it moves in this swarm of structure where you move up and you move down and your mid and low time frame are trending down and your low time frame Marks back to bullish confirming a potential pivot point on the high time frame and it work it it it it moves in this swarm where if you understand it you can literally have you can always be on the right side of the market from a high time frame context perspective and right now I'm showing you guys on the high time frame I'm showing you on the daily the 4 Hour and the 1 hour it works the exact same way locally when you know your black markers are drawing so your high time frame might be representing the 30 minute and then you have the 10 minute and you have the 3 minute works the exact same way but it's so effective like you can see it I'm showing it you guys right here I'm literally I'm showing it you it's so so so effective so really really take your time practicing this because once you have mastered this everything else will become so much easier so much easier so much easier.

okay now let's come back to that Wick situation okay and how you can determine based on understanding that domino effect now how you can determine which scenario is most likely to happen for the Wicks. In situation one to have a full rotation down you have to have in order to have a full rotation down you have to Wick the high and most likely you have structure from the low up that breaks back the bearish



okay our mid-time frame structure so when you Wick the high and you break your mid time frame structure so your structure from the low up back to bearish that's when you're going to have that full rotation down towards your Market structure low when that doesn't happen okay and this is your mid time frame low and you never break that mid time frame low and you go on the low time frame and you see that structure from the top down breaking back to bullish.  That's when you confirm situation two



and situation three speaks for itself:

let's look at it actually from the example I was showing you guys right here(see screenshot below).

right here you have a wick of the high SFP:

and then you Wick the low so this in these situations you had a full rotation um back down and back up

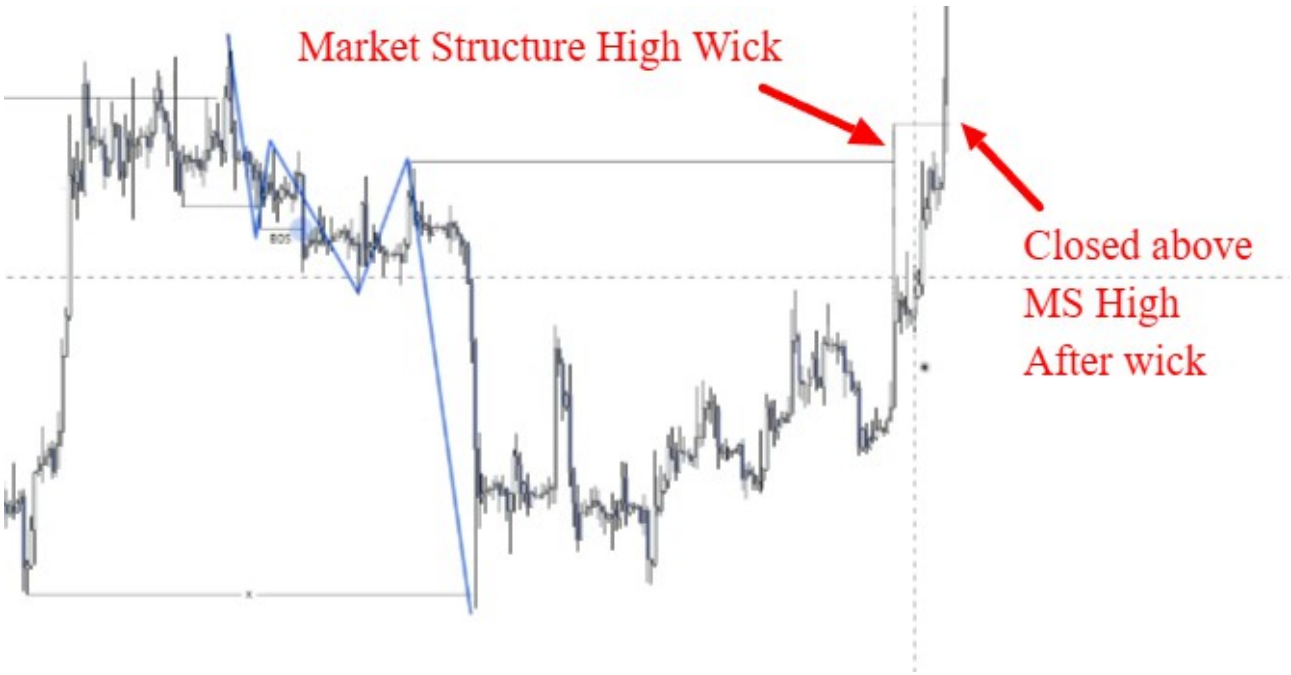
let's see if we can apply that structure I just gave you as a little trick right here let's go on the low time frame 6 Hour.

as you can see(see screenshot above) while drawing your structure while drawing your structure from the low up we have a low we have a high a higher low higher high higher low did it Wick it yeah all the way up to here and then we broke it

so we broke our structure first we Wicked it okay first we Wicked there we broke it so on the high time frame right here the moment we broke it right here that confirmed the rotation back down towards that Mark structure low:

okay and the other one was a bit more sketchy because you didn't really have that much structure you didn't have that much structure because right here we wck the low but our structure from top to bottom our structure from top to bottom was looking like this

where this is our Mark structure High and we Wicked it right there and then we closed above it afterwards(see screenshot below):



we got the reaction away so this becomes our new break of structure but that was already very close to this high but this was just such an aggressive expansion maybe it's low time frame structure on the one hour nah it was just such a big wig gu it was such a massive move down this was trickier to trade and we'll get into how you can trade those situations in later videos in this mentorship but you can see you know that the moment we break our structure from the low up after wicking the high we can have that full rotation down and let's say this was structure you know let's say this was some sort of structure right here that will mean that the moment you break it's very ugly drawn okay that will mean that the moment you break this high right here the moment you break that high that will confirm that rotation back up towards your new Wick high
